

SERVICE CHECKLIST

1 CHECK POWER & ELECTRICAL CONNECTIONS

- Ensure the unit is plugged in and switched on.
- Verify that the power supply is functioning (try another device on the same outlet)
- Look for tripped circuit breakers or blown fuses

2 INSPECT TEMPERATURE SETTINGS

- Check the thermostat settings—ensure they are appropriate for the required cooling
- If adjustable, confirm the settings haven't been accidentally changed

3 EXAMINE AIRFLOW & VENTILATION

- Make sure air vents are unobstructed
- Confirm that fans inside the unit are operating

4 EVALUATE CONDENSER & EVAPORATOR COILS

- Clean condenser coils — dirt and dust accumulation can reduce efficiency
- Ensure evaporator coils aren't frozen over

5 LISTEN FOR UNUSUAL NOISES

- Clicking, hissing, or loud buzzing noises may indicate an electrical issue

6 CHECK DOOR SEALS & GASKETS

- Worn or damaged seals can cause air leaks and inefficient cooling

7 TEST THE DRAIN LINE & DEFROST SYSTEM

- A clogged or frozen drain line can lead to excessive water leaks
- Verify that the defrost cycle is functioning properly
